
malicious flow
attacker-controlled
1
perturb to evade detector f
$f(x')=0$?
yes
alarm suppressed
(evasion by detection)
2
keep $f(x)=1$, reshape $e(x)$
e looks benign?
yes
analyst dismisses
(evasion by explanation)
On tabular NIDS this route does not transfer
low-dim, manifold-constrained
features: reshaping e
without flipping f is hard (our negative result)
